This is a Simple **Breakout Box** for various types of jacks to interconnect. The Banana jacks are the exception, they are to be used for probe plugs for “audio probe” use and will work on the “tip” of anything plugged into the stereo jacks or any of the mono jacks on the right side (Tip side) of the schematic. For example, a guitar or amp plugged into J1 or J8 will work for probing (probe from J9 to connect to the ground of the circuit being probed).
