

DeArmond Volume Pedal Model 1602

The 1 Meg pot is shown as you look at the back of the pot. The pot has a plastic pinion and the pedal has a plastic rack, similar to the "Crybaby wah wah pedal. The wiring is shielded wire with the shield connected at the "sleeve" of the jacks on one end, and at lug 1 of the pot on the other end.

The Ernie Ball Volume pedal has the exact same wiring, but does not use shielded wire and the pot is a Clarostat 250k ohm Extended Life pot.
