This is a circuit from a Marshall amp that provide a “speaker simulation” sound to the direct out of the amplifier. This is an awesome circuit to run from your signal to a direct box.

Use the project documents provided, starting with the General Build Instructions. This is a fairly simple build since there are no knobs and you don't need the foot switch and LED. We added the bypass foot switch so that we could test it, A/B the sound with and without the simulator.
